

Django ERP System Steps

i need to make it in django , what steps needed

You're basically trying to convert that diagram into a **Django-based ERP system with multiple modules (apps)**. The right way is *not* to build everything in one app, but to split it cleanly.

I'll walk you step-by-step in a **practical, buildable way**.

🧠 1. Understand Your Diagram (Convert to Django Thinking)

Your diagram becomes:

Core System

- ERP (main Django project)

Modules (Django Apps)

- Public Page → **public_app**
- Student Page → **students**
- Faculty Page → **faculty**
- HOD Page → **hod**
- Events Page → **events**
- Workshop Page → **workshop**
- Exam Dept → **exam**
- Fees Dept → **fees**

👉 Each box = **one Django app**

⚙️ 2. Create Project

```
django-admin startproject erp_system
cd erp_system
python manage.py runserver
```

3. Create Apps (Important Step)

```
python manage.py startapp public_app
python manage.py startapp students
python manage.py startapp faculty
python manage.py startapp hod
python manage.py startapp events
python manage.py startapp workshop
python manage.py startapp exam
python manage.py startapp fees
```

4. Register Apps

In `settings.py`:

```
INSTALLED_APPS = [
    ...
    'public_app',
    'students',
    'faculty',
    'hod',
    'events',
    'workshop',
    'exam',
    'fees',
]
```

5. Project Structure (Clean Way)

```
erp_system/
├── erp_system/ (main settings)
├── public_app/
├── students/
├── faculty/
├── hod/
├── events/
├── workshop/
├── exam/
├── fees/
├── templates/
│   ├── base.html
│   ├── public/
│   ├── students/
│   ├── faculty/
│   └── ...
└── static/
```

6. URL Routing (Very Important)

Main `urls.py`

```
from django.contrib import admin
from django.urls import path, include

urlpatterns = [
    path('admin/', admin.site.urls),
    path('', include('public_app.urls')),
    path('students/', include('students.urls')),
    path('faculty/', include('faculty.urls')),
    path('hod/', include('hod.urls')),
    path('events/', include('events.urls')),
    path('workshop/', include('workshop.urls')),
    path('exam/', include('exam.urls')),
    path('fees/', include('fees.urls')),
]
```

7. Example: One App Setup (Students)

students/urls.py

```
from django.urls import path
from . import views

urlpatterns = [
    path('', views.dashboard, name='student_dashboard'),
]
```

students/views.py

```
from django.shortcuts import render

def dashboard(request):
    return render(request, 'students/dashboard.html')
```

8. Base Template (VERY IMPORTANT)

Create templates/base.html

```
<!DOCTYPE html>
<html>
<head>
    <title>ERP System</title>
</head>
<body>

<nav>
    <a href="/">Public</a>
    <a href="/students/">Student</a>
    <a href="/faculty/">Faculty</a>
    <a href="/hod/">HOD</a>
    <a href="/events/">Events</a>
</nav>

<hr>

{% block content %}{% endblock %}

</body>
</html>
```

9. Role-Based Access (Key ERP Feature)

You'll need authentication:

```
python manage.py migrate
python manage.py createsuperuser
```

Use:

- `is_staff` → Faculty
- `is_superuser` → Admin/HOD
- Custom user model → Best option (advanced)

10. Models Design (Basic Idea)

Example:

Students App

```
class Student(models.Model):
    name = models.CharField(max_length=100)
    roll_no = models.CharField(max_length=20)
    department = models.CharField(max_length=50)
```

Faculty App

```
class Faculty(models.Model):
    name = models.CharField(max_length=100)
    subject = models.CharField(max_length=100)
```

Fees App

```
class Fees(models.Model):
    student = models.ForeignKey(Student, on_delete=models.CASCADE)
    amount = models.IntegerField()
    status = models.BooleanField()
```

11. Permissions (VERY IMPORTANT for your diagram)

Use decorators:

```
from django.contrib.auth.decorators import login_required

@login_required
def dashboard(request):
    return render(request, 'students/dashboard.html')
```

Advanced:

- Groups: Student / Faculty / HOD
- Permissions per app

12. Final Flow Mapping

Diagram Block	Django
ERP	Main Project

Diagram Block	Django
Pages	Apps
Managed IT (Both)	Shared services / common models
Departments	Separate apps

⚠ Common Mistake (Avoid This)

- ✗ Don't put everything in one app
- ✗ Don't skip URL separation
- ✗ Don't ignore authentication early

✅ If You Want Next Step

I can now:

- Build **full folder structure + code starter**
- Create **login system (Student / Faculty / HOD)**
- Design **dashboard UI like your diagram**
- Or convert this into a **complete working mini ERP**

Just tell me:

👉 *"build full starter project" or "make login system"*
